Soft tissue has been found in dinosaur bones?

CREATION.com

THAT'S RIGHT!

Cows grazing or resting in a field tend to align themselves with the earth's magnetic field. In fact, many animals including deer, birds, turtles, bats, and even some bacteria, can sense the earth's magnetic field—an amazing design feature for alignment or navigation.

Genesis 1

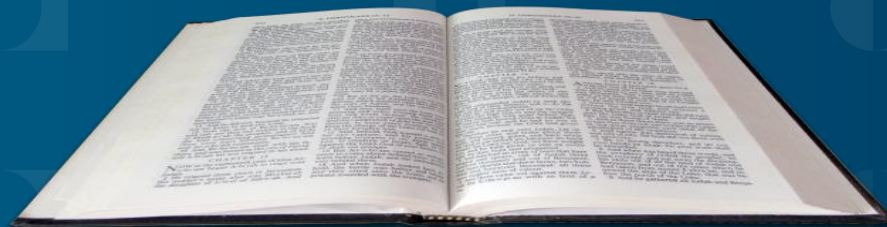

Neil deGrasse
Tyson

Wherefore, as by one man sin entered into the world, and death by sin; and so death passed upon all men, for that all have sinned:

Romans 5:12

For we know that the
whole creation has
been groaning
together in the pains of
childbirth until now.

Romans 8:22

The rise of the bipedal ape

The rise of the bipedal ape

ancestors would be found in Africa.

Our evolutionary history

The incredible story of the evolution of humans from our ape ancestors covers approximately 7 million years, so life has existed for approximately 4 billion years, so 6 million years is really a snapshot in time, but how many years of your own family tree can you trace back in time? Maybe a couple of hundred if you're lucky.

Darwin's *On the Origin of Species*, published in 1859, suggested that humans were descended from African apes. With no fossils of our ancestors discovered until 1924, Darwin's suggestion was considered ridiculous and insulting to the human race. In 1924, Raymond Dart dug up the *Taung child* in Africa—a 3–4 million-year-old Australopithecine and our distant ancestor.

Since Dart's discovery nearly a century ago, approximately twelve to nineteen different species of human ancestor have been identified—although scientists are continually arguing and modifying their stance on the relationships between the fossil finds. As more fossils are uncovered, and more analyses performed, it is expected that the story of human evolution itself will continue to evolve.

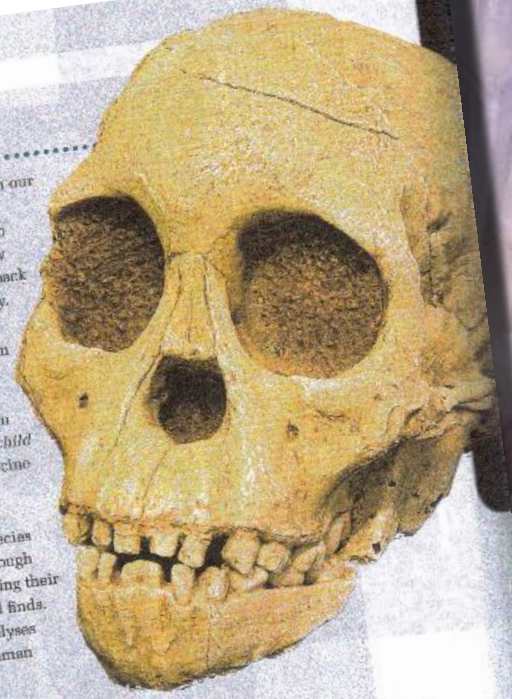

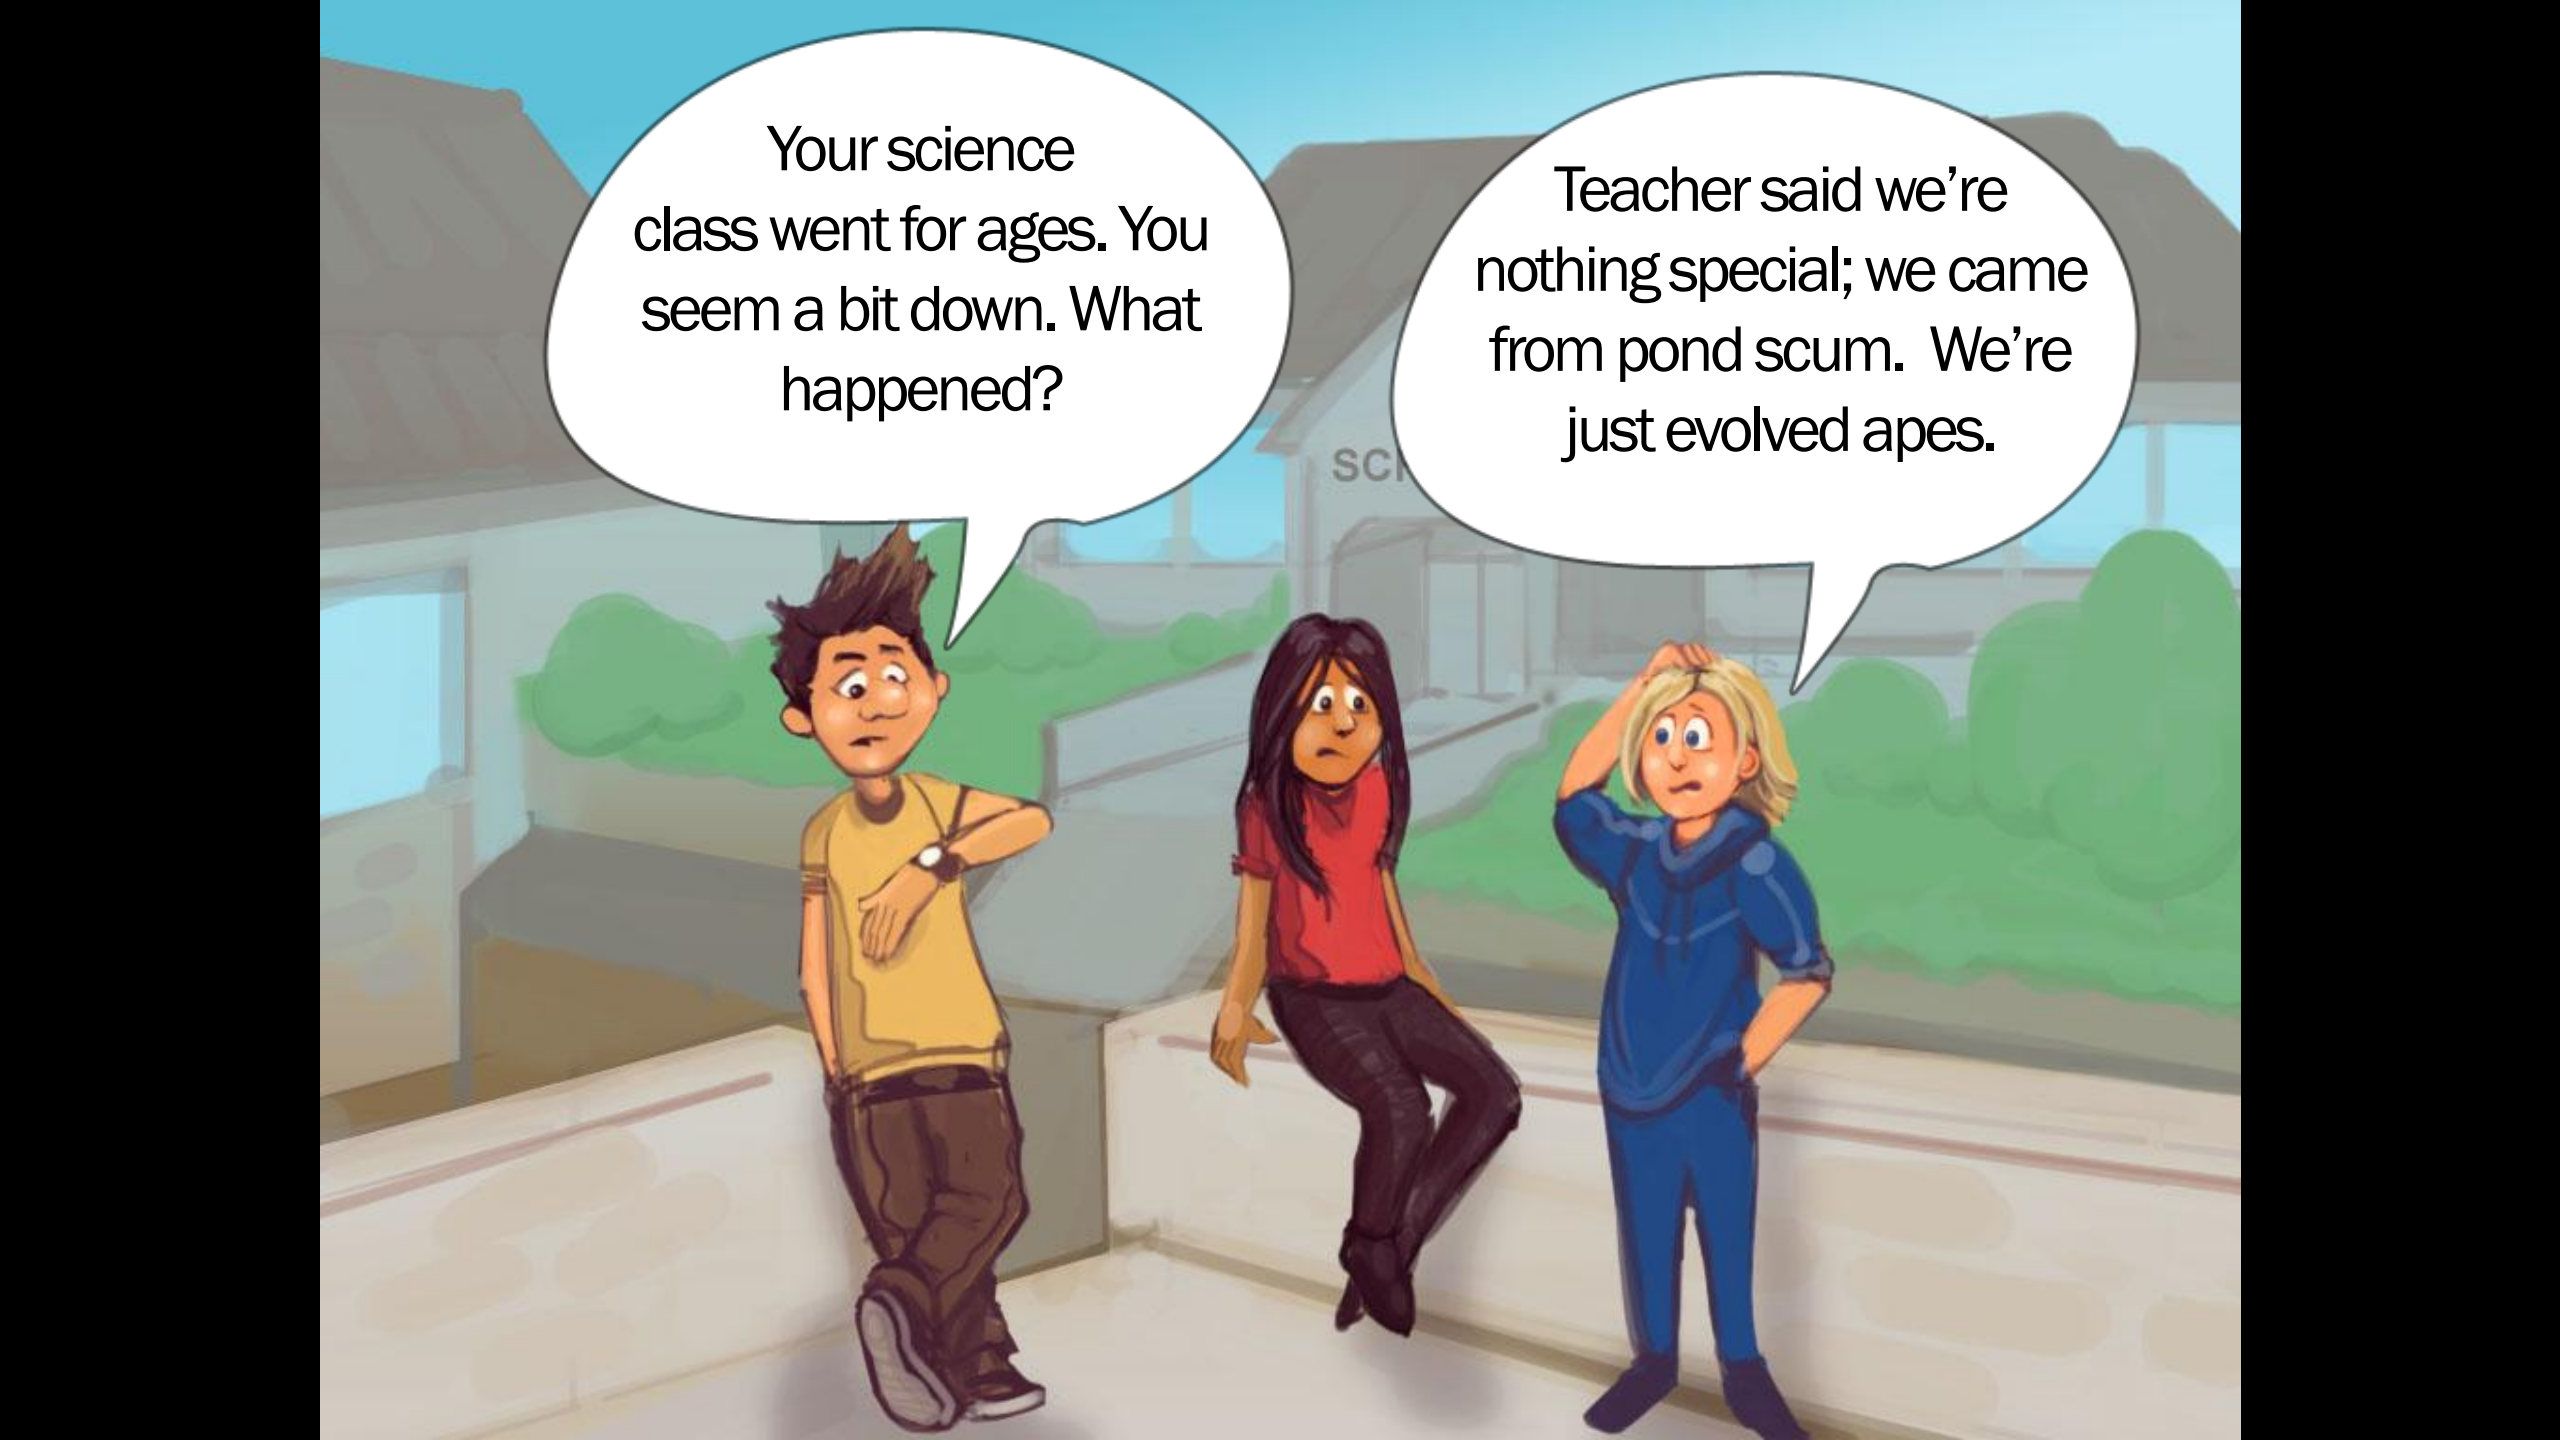

Fig 5.85 The skull of the Taung child—a 3–4 million-year-old distant ancestor.

A comic book illustration showing three students on a school balcony. On the left, a boy with spiky brown hair, wearing a yellow t-shirt and brown pants, looks towards the other two. In the center, a girl with long dark hair, wearing a red t-shirt and black pants, sits on the balcony railing with a sad expression. On the right, a boy with blonde hair, wearing a blue tracksuit, stands with his hand on his head, looking distressed. The background shows a school building with a sign that says 'sci' and some green bushes under a clear blue sky.

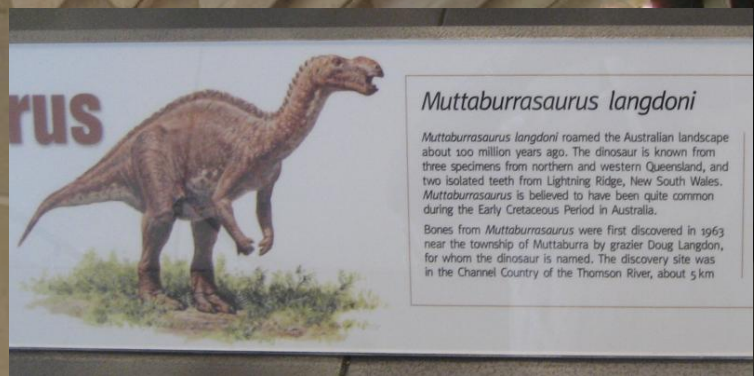

Your science class went for ages. You seem a bit down. What happened?

Teacher said we're nothing special; we came from pond scum. We're just evolved apes.

What are they
teaching in your
next class?

Muttaburrasaurus langdoni

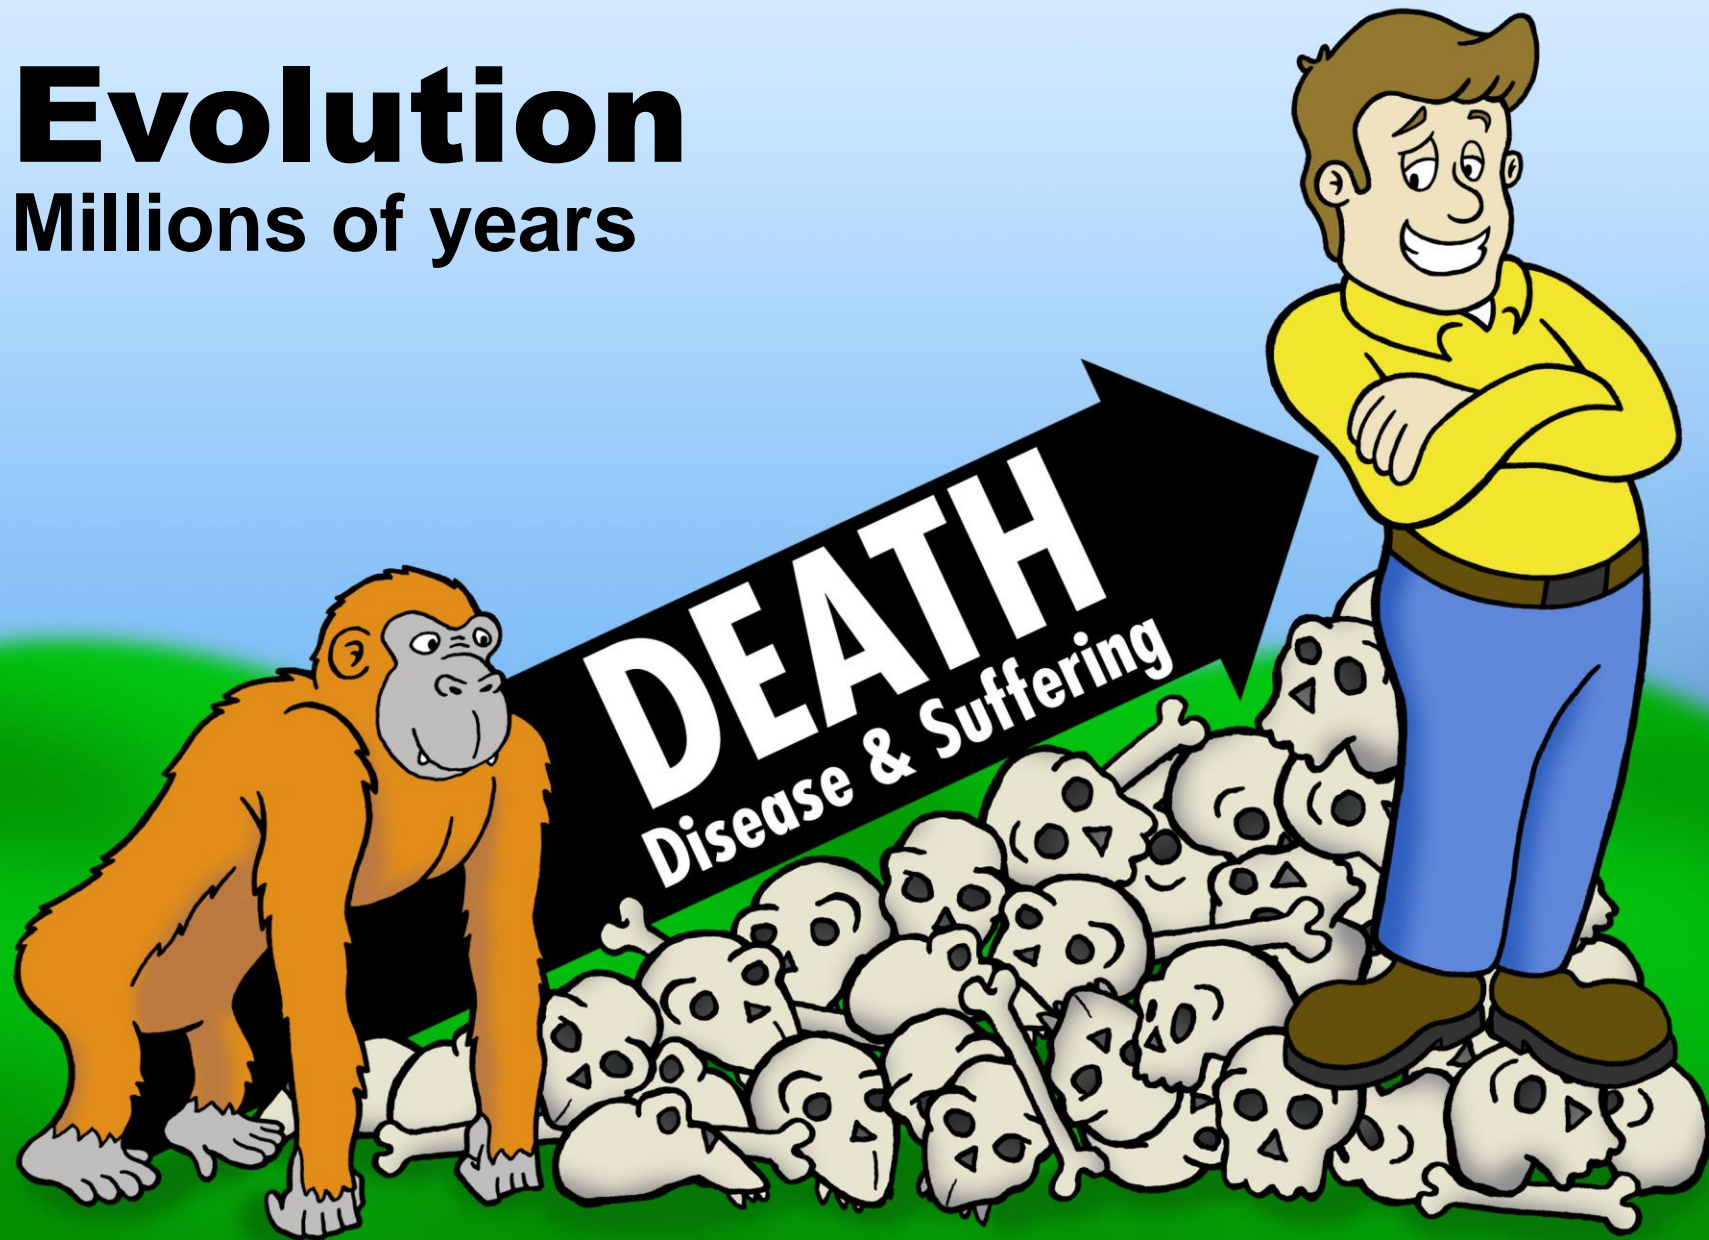

Muttaburrasaurus langdoni roamed the Australian landscape about 100 million years ago. The dinosaur is known from three specimens from northern and western Queensland, and two isolated teeth from Lightning Ridge, New South Wales. *Muttaburrasaurus* is believed to have been quite common during the Early Cretaceous Period in Australia.

Bones from *Muttaburrasaurus* were first discovered in 1963 near the township of Muttaburra by grazier Doug Langdon, for whom the dinosaur is named. The discovery site was in the Channel Country of the Thomson River, about 5 km
